

**Day 69 coding Statement :** Suppose, we have a class A which is the base class and we have a class B which is derived from class A and we have a class C which is derived from class B, we can access the functions of both class A and class B by creating an object for class C.

Hence, this mechanism is called multi-level inheritance. (B inherits A and C inherits B.)

Create a class called Equilateral which inherits from Isosceles and should have a function such that the output is as given below.

### Sample Output

I am an equilateral triangle

I am an isosceles triangle I am a triangle

```
class isosceles{
    public void isoscelesPrint(){
        System.out.println("I am an equilateral triangle");
    }
}
class Equilateral extends isosceles {
    public void EquilateralPrint (){
        System.out.println("I am an isosceles triangle I am a triangle");
    }
}
public class RatanPrajapati_day69 extends Equilateral {
    public static void main(String[] args) {
        RatanPrajapati_day69 C = new RatanPrajapati_day69();
        C.isoscelesPrint();
        C.EquilateralPrint();
    }
}
```
